

HW1: FARKLE

This is my Farkle Project made in Java through VS Code! It contains all of the basic functionality for a single-player, single-turn Farkle game played through the command line as a UI. This is my first time ever coding in Java, so this was a fun new challenge and good puzzle to get me into this new coding language!

By Jett Marleau

PROCESS

Class and design Structure

For this project, I defined a Dice, Score, and Turn class that would each carry out their respective functions to roll the dice, calculate scores, and prompt the user to make choices to hopefully increase their score.

Design Challenges

My biggest issue was knowing next to nothing about Java syntax and compiling. Almost every line of code I wrote initially had bugs or compilation errors in them. This led to major roadblocks, as I spent many hours watching online Java tutorials (as cited in the code) and learning how to operate the language

Future Changes

Since this is my first Java project, the structure is obviously quite cluttered. Most of the logic involves long, clunky blocks of it statments with multiple conditions. If I had more time, I would love to optimize and clean my code so it is more concise.
